If your oil separator has a hole in the molded bracket, reinstall wiring harness pushpin in that hole, for retention. Lightly lubricate the inner O-rings of the PCV tube connectors with engine oil and install tubes per the illustration.

Maintenance is based on the type of driving the vehicle is subjected to. Track type driving will require more frequent checks for accumulation of oil in the separator. Remove separator and tilt so to empty oil out from the lower fitting. Do not empty from upper fitting! If removal of the top cover is required, when reinstalling, torque socket head screws to 4.5 to 5 Nm.
